All Sheets:

- I removed duplicates from all sheets
- I removed spaces from all columns
- All sheets I capitalize All headers by using (PROPER())

ai_jobs Sheet:

- I removed empty Columns
- I created two columns Avg Salaries and experience level
- Average Salaries in order to get the average highest Salary for all jobs
- Experience Level order to sort as 1, 2, 3 excel cann't sort as Entry , mid , senior , ADD New column Called Experience_Level_Order
- City column: I replaced name from remote to No City
- Job_Title : I replaced name from MLOps Engineer to Mlops Engineer

Job_ id Column: I use **trasform** to lower case **job_id column IN ai_jobs** and **skills demand sheets**

Relationships I make relationships between **ai_jobs**(one) one to many and **skills_demand**(many) **Key**(Job_Id)

ai_jobs ↔ job_title_mapping **key** (Job_Title)

Problem: I noticed that some ids in Job_Id and skills_demand are not matched so I checked them by using If(countif) to show me matched and not matched ,SO Now Job_Id and skills_demand Are matched

I worked on the matched data only
