Project Description

This project analyzes the AI job market to understand key trends in job opportunities, salaries, skills demand, and geographic distribution.

The analysis is based on multiple datasets that include job details, required skills, and market trends across different countries and years.

The main goal is to answer important questions such as:

- **What are the most common AI job roles?**
- **Which countries offer the most opportunities?**
- **How do salaries vary by job title, experience, and location?**
- **What skills are most in demand in the AI field?**

The project uses the following :

- **Excel** for initial data cleaning and preparation
- **SQL** for data querying, transformation, and performance optimization
- **Python** for advanced data analysis and processing
- **Power BI** for data visualization and building interactive dashboards

The final output of the project is a set of clear insights and interactive visualizations that help in understanding the current state of the AI job market and support data-driven decision-making.
